## Lynx Pardinus

- Kingdom: Animalia
- Phylum: Chordata
- Class: Mammalia
- Order: Carnivora
- Suborder: Feliformia
- Family: Felidae
- Genus: Lynx
- Species: *Lynx pardinus*

The iberian lynx is an endemism of iberian peninsula critically endangered. Their distrubition is arround Doñana Natural Park and Sierra de Andujar. Its habitat is the heathland and shrub, woodland and forest. Diet's lynx is mostly rabbits, but some birds and small mammals as well. Myxomatosis was a disease developed by some mad doctor from Australia in order to reduce rabbits population. But it was a world disaster threatening all trophic levels like the case of this kind of lynx. Consanguinity or blood relathionship and habitat fragmentation between Doñana Natural Park and Sierra de Andujar are the main problems for the iberian lynx.
