URBANIZATION

The worst polluted city in the world

New Delhi is a massive city that has experienced a huge expansion in a few years. It's the biggest city in the world after Tokyo and is worryingly overcrowded, counting with more than 28 million people. The urban sprawl has overflowed urban management and poor people is forced to move in suburbs or slums, perpetuating their poverty. Furthermore, the people migration from rural to urban areas looking for industrial job and a better life get these places in the city in a worse situation, becoming unsanitary spots in peripheral and marginal areas.

To conclude, the fast urbanization has deforested the natural spaces in a blink of an eye, causing an urban heat island and an increase in temperature, so light and noise pollution, creating the photochemical smog, makes this city one of the most polluted on the planet.
